

1. Per-subject collapse

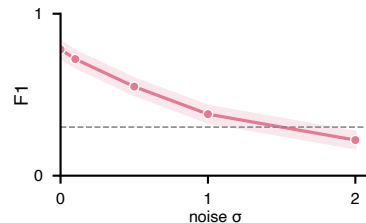

Aggregate accuracy hides catastrophic failure on a subset of subjects

2. Modality shortcut

Removing one sensor at test time collapses prediction. Model leaned on one modality.

3. Sensor degradation

Test-time noise drops F1 toward chance across architectures.

Three faces of one structural problem:
**distribution shift that current fusion
architectures cannot bridge**

Proposed direction:
neuro-inspired architectural priors
(e.g., cross-modal generative — see inset)
